

# Scientific Notation

Scientific notation is used to express very large or small numbers.

Ex.  $6.02 \times 10^{23}$

*The decimal goes  
after the first number*

*The exponent (or  
power of 10) show  
shows how far the  
decimal point moved*

A *positive* exponent represents a number GREATER than 1.

$$5.243 \times 10^3$$

A *negative* exponent represents a number LESS than 1.

$$5.243 \times 10^{-3}$$

# Scientific Notation Practice

Convert each of the following numbers to standard notation.

- a.  $3.4 \times 10^5$
- b.  $2.8 \times 10^3$
- c.  $6.1 \times 10^{-2}$
- d.  $7.8 \times 10^{-4}$

Convert each of the following numbers to scientific notation.

- a. 5600
- b. 0.00921
- c. 980,000
- d. 0.0000073

# Scientific Notation Practice Ans.

- Convert each of the following numbers to standard notation.

- a.  $3.4 \times 10^5$   
340,000
- b.  $2.8 \times 10^3$   
2800
- c.  $6.1 \times 10^{-2}$   
0.061
- d.  $7.8 \times 10^{-4}$   
0.00078

- Convert each of the following numbers to scientific notation.

- a. 5600  
 $5.6 \times 10^3$
- b. 0.00921  
 $9.21 \times 10^{-3}$
- c. 980,000  
 $9.8 \times 10^5$
- d. 0.0000073  
 $7.3 \times 10^{-6}$

# **SI Units** - **S**ystème **I**nternational d'Unites, or International System of Units

MOST countries use SI units.

SI units are used in science.

## **BASE UNITS**

<b>Quantity</b>	<b>Base Unit</b>	<b>Abbreviation</b>
Length	meter	m
Mass	kilogram	kg
Time	seconds	sec
Temperature	Kelvin	K
Amount	moles	mol

# SI UNITS

What is Kelvin?

$$\text{Kelvin} = ^\circ\text{C} + 273$$

Written as K only (no degree “°” sign)

$$\text{Ex. } 15^\circ\text{C} + 273 = 288 \text{ K}$$

**Derived Units** Combination of base units.

Ex. Volume = length x width x height = liters (l)

Density = mass/volume = g/ml

# SI UNITS

UNITS MATTER!!

ALL MEASUREMENTS MUST HAVE:

A MAGNITUDE (number)

UNITS (label)

Ex. 25 kg,  $2.03 \times 10^{13}$  m,  $3.04 \times 10^{-2}$  mol

# SI UNITS - Prefixes *(Need to memorize!)*

<b><u>K</u>ing</b>	<b><u>H</u>enry</b>	<b><u>D</u>ied</b>	<b><u>B</u>y</b>	<b><u>D</u>rinking</b>	<b><u>C</u>hocolate</b>	<b><u>M</u>ilk</b>	<b><u>M</u>onday</b>	<b><u>N</u>ight</b>
<b>Kilo</b>	<b>Hecto</b>	<b>Deka</b>	<b>BASE</b>	<b>Deci</b>	<b>Centi</b>	<b>Milli</b>	<b>Micro</b>	<b>Nano</b>
<b>1000</b> <b><math>1 \times 10^3</math></b>	<b>100</b> <b><math>1 \times 10^2</math></b>	<b>10</b>	<b>1</b> <b>How many (g,L,m) in each unit)</b>	<b>0.1</b>	<b>0.01</b> <b><math>1 \times 10^{-2}</math></b>	<b>0.001</b> <b><math>1 \times 10^{-3}</math></b>	<b><math>1 \times 10^{-6}</math></b>	<b><math>1 \times 10^{-9}</math></b>

# Density

The density of an object will remain the same, regardless of the amount of the object.

$$\text{Density} = \frac{\text{Mass}}{\text{Volume}}$$

Ex. A liquid has a density of 0.87 g/mL and a mass of 0.025 kg. What is its volume?

## Volume:

Objects with a familiar shape → a formula can be used to calculate volume.

Ex. Cube = length X width X height =  $\text{cm}^3$

Odd shaped objects--- use **water displacement method...**

# Density practice problems - answers

1. A block of aluminum occupies a volume of 15.0 mL and weighs 40.5 g. What is its density?

$$D = 40.5/15 \quad d = 2.7 \text{ g/mL}$$

2. What is the weight of the ethyl alcohol that exactly fills a 200.0 mL container? The density of ethyl alcohol is 0.789 g/mL.

$$.789 = m/200 \quad m = 157.8 \text{ g}$$

3. A rectangular block of copper metal weighs 1896 g. The dimensions of the block are 8.4 cm by 5.5 cm by 4.6 cm. From this data, what is the density of copper?

$$V = 8.4 \times 5.5 \times 4.6 \quad d = 1896/212.52$$
$$V = 212.52 \text{ cm}^3 \quad d = 8.9 \text{ g/cm}^3$$

4. 28.5 g of iron shot is added to a graduated cylinder containing 45.50 mL of water. The water level rises to the 49.10 mL mark, from this information, calculate the density of iron.

$$V = 49.10 - 45.5 \quad d = 28.5/3.6$$
$$V = 3.6 \text{ mL} \quad d = 7.9 \text{ g/mL}$$

# SI UNITS - Conversion

Ex. *How many grams are in 200 kg?*

To convert from one unit to the other,  
start with what you have. **200 kg**

Create a conversion factor:

$$200 \text{ kg} \times \frac{1 \times 10^3 \text{g}}{1 \text{ kg}} = 200,000 \text{ g}$$

k	kilo	$10^3$
h	hecto	$10^2$
d	deka	$10^1$
<b>B</b>	<b>BASE</b>	<b>10</b>
d	deci	$10^{-1}$
c	centi	$10^{-2}$
m	milli	$10^{-3}$
$\mu$	micro	$10^{-6}$
n	nano	$10^{-9}$

# Conversion Methods

FYI - In class, you will see me do conversions similar to the example below.

$$56.78 \text{ cm} \times \frac{1 \times 10^{-2} \text{ m}}{1 \text{ cm}} \times \frac{1 \text{ km}}{1 \times 10^3 \text{ m}} = 5.678 \times 10^{-4} \text{ km}$$

You can also use the T-bar method.

$$56.78 \text{ cm} \left| \frac{1 \times 10^{-2} \text{ m}}{1 \text{ cm}} \right| \frac{1 \text{ km}}{1 \times 10^3 \text{ m}} = 5.678 \times 10^{-4} \text{ km}$$

Both methods yield the same result, it is just a different way to set up your conversions. Both methods are acceptable. It is your preference as to which one to use!

## Percent Error - Example

In lab, you measure the mass of your sample to be 6.2 g. Reliable sources indicate that the actual mass of the sample should have been 8.3 g. What was your percent error?

- $\frac{|6.2 - 8.3|}{8.3} \times 100 = 25.3\% \text{ error}$

## Percent Error

**Percent Error** – A way of expressing accuracy

$$= \frac{|\text{experimental value} - \text{accepted value}|}{\text{accepted value}} \times 100\%$$

- \* **Accepted value** (or true value)– correct value based on reliable references
- \* **Experimental value** – value measured in the lab

Shaq was precise with free throws. He just wasn't accurate.

Accurate = Correct  
Precise = Consistent

# Precision vs Accuracy

## Accuracy:

How close a measurement comes to the correct (true) value

## Precision:

How close a series of measurements are to one another

# The Mole

What is a mole??

A unit of measurement

How many molecules are in  
a substance

$$1 \text{ mol} = 6.022 \times 10^{23}$$

This is also called Avogadro's Number

## Moles - Answers

1. How many molecules are in 3.2 moles of water

$$3.2 \text{ mol} \times \frac{6.02 \times 10^{23} \text{ molecules}}{1 \text{ mol}} = \mathbf{1.92 \times 10^{24} \text{ molecules}}$$

2.) How many moles are in  $5.34 \times 10^{24}$  atoms of Copper?

$$5.34 \times 10^{24} \text{ atoms} \times \frac{1 \text{ mol}}{6.02 \times 10^{23}} = \mathbf{8.87 \text{ moles}}$$

3.) How many molecules are in 2.43 mol of  $\text{CO}_2$ ?

$$\mathbf{1.46 \times 10^{24} \text{ molecules}}$$

4.) Calculate the number of moles in  $7.12 \times 10^{22}$  atoms of Mg.

$$\mathbf{0.118 \text{ moles}}$$

# Significant Figures

- Counting Sig Figs
  - Count all numbers EXCEPT:
    - Leading zeros -- 0.0025
    - Trailing zeros *without* a decimal point -- 2,500

# Significant Figures

## Counting Sig Fig Examples

1. 23.50      4 sig figs
2. 402      3 sig figs
3. 5,280      3 sig figs
4. 0.080      2 sig figs

# Significant Figures

- Calculating with Sig Figs
  - Multiply/Divide - Multiply or divide as usual, then the # with the fewest sig figs determines the # of sig figs in the answer.

$$\begin{array}{ccc} (13.91 \text{ g/cm}^3) & (23.3 \text{ cm}^3) & = & \downarrow & 3 \text{ SF} \\ \begin{array}{c} 4 \\ \text{SF} \end{array} & \begin{array}{c} 3 \\ \text{SF} \end{array} & & & \\ 324.103 \text{ g} & & & & 324 \text{ g} \end{array}$$

# Significant Figures

- Calculating with Sig Figs (con't)
  - Add/Subtract - You would add (or subtract) the numbers as usual, but then you would round the answer to the same decimal place as the least-accurate number.

$$\begin{array}{r} 3.75 \text{ mL} \\ + 4.1 \text{ mL} \\ \hline 7.85 \text{ mL} \end{array} \rightarrow 7.9 \text{ mL}$$
$$\begin{array}{r} 224 \text{ g} \\ + 130 \text{ g} \\ \hline 354 \text{ g} \end{array} \rightarrow 350 \text{ g}$$
